

# Infection Prevention & Control Custom Education

Tailored education that will help your team implement improvements and strategies to protect your patients, staff and visitors

While the principles of infection prevention and control (IPC) remain the same, the implementation of the guidelines and processes related to these principles are becoming more and more complex. This complexity often leads to inconsistent practices which can result in patient harm, and many times condition-level deficiencies, adverse survey decisions, and Immediate Jeopardy. To help make sure your organization is implementing effective IPC guidelines and processes, contact a subject matter expert who can educate your team to help you implement infection prevention excellence across your continuum.

Joint Commission Resources® offers, among its services, an education program that is customizable to your organization and tailored to your unique IPC needs and challenges. For a flat fee, our team of experts will come to your organization to train your entire staff - senior leaders, physicians, infection prevention specialists, clinical managers and frontline staff critical to infection prevention excellence - on the challenges of IPC. This training will not only focus on the regulatory challenges of IPC, but also on the emerging and challenging issues of implementing the core principles of infection prevention across all services and populations you serve.

This tailored course may carry continuing education credits, including those from the Accreditation Council for Continuing Medical Education (ACCME); American Nurses Credentialing Center (ANCC); American College of Healthcare Executives (ACHE); Certified Joint Commission Professional (CJCP); and the International Association for Continuing Education (IACET).
